# HOW TO USE GITHUB

PRESENTED BY LOLITA HARO

# What is GitHub

It is an online software development platform used to store, monitor and work with software projects.

# The history of GitHub

- The great GitHub platform was created by Chris Wanstrath, PJ Hyett, Tom Preston-Werner and Scott Chacon in February 2008 in San Francisco - USA and to this day it is still located in the same place.
- In February 2009, the members of the company announced in an interview for Yahoo that GitHub had already reached more than 46 thousand public repositories, a good amount that indicated the popularity that was going to come for Github.
- On January 16, 2013, Github notably affirmed itself by announcing that it had surpassed more than 10 million repositories on its platform.
- Github continues to grow constantly and has become the most popular platform for hosting projects in the cloud, it has other competitors such as Bit Bucket, Mercurial, GitLab among others, but apparently Github continues to predominate as of the date of this article, in the future we do not know What may happen, the important thing is to take advantage of this platform for our projects.

USED FOR VERSION CONTOL

USED FOR HOSTING GIT REPOSITORIES

INSTALLED LOCALLY ON COMPUTER
